

Semantics 2

Simple sentences, ~~copula~~

Manfred Sailer

1.11.2016

Literary scenario for the class: Back to the Future

Characters:

Marty McFly

Lorraine Baines-McFly

George McFly

Dr. Emmett "Doc" Brown

Biff Tannen

Jennifer Parker

.....

Homework for today

- Read Chapter 3 of the textbook, p.79-104
- Provide the logical form of the sentence: *Marty travelled.*
- Compute the truth conditions of the sentence in your model.
- Provide the lexical entries and the syntactic analysis of the sentence (indicate the features PHON, HEAD, and SUBCAT)

Marty travelled.

$travel_1(marty)$ (without "event")

$travel_2(u, marty)$

Mari: ~~⊗ ⊗ ⊗ ⊗ ⊗ ⊗ ⊗ ⊗~~ ⊗

$g: \text{Variable} \mapsto \text{Individuals}$
 $\text{Var} \mapsto U$

$\llbracket \text{travel}_2(u, \text{marly}) \rrbracket^{M, g} = \text{true}$
 \bullet iff $\langle \llbracket u \rrbracket^{M, g}, \llbracket \text{marly} \rrbracket^{M, g} \rangle$
 is in $\llbracket \text{travel}_2 \rrbracket^{M, g}$
 iff $\langle g(u), \bar{I}(\text{marly}) \rangle$
 is in $\bar{I}(\text{travel}_2)$
 iff $\langle \text{img}, \bar{x} \rangle$ is in
 $\{ \langle e, x \rangle \mid e \text{ is a travel event with } x \text{ as the traveler} \}$

Since this is the case,
 $\llbracket \text{travel}_2(u, \text{marly}) \rrbracket^{M, g}$
 $= \text{true}$.

$g(u) =$

The image shows a screenshot of a digital clock interface. The top display, labeled 'DESTINATION TIME', shows 'NOV 05 1955' in red LEDs. The bottom display, labeled 'PRESENT TIME', shows 'OCT 26 1985' in green LEDs. The interface includes labels for 'MONTH', 'DAY', and 'YEAR' for both displays, and 'AM'/'PM' indicators. The screenshot is taken from a web browser window.

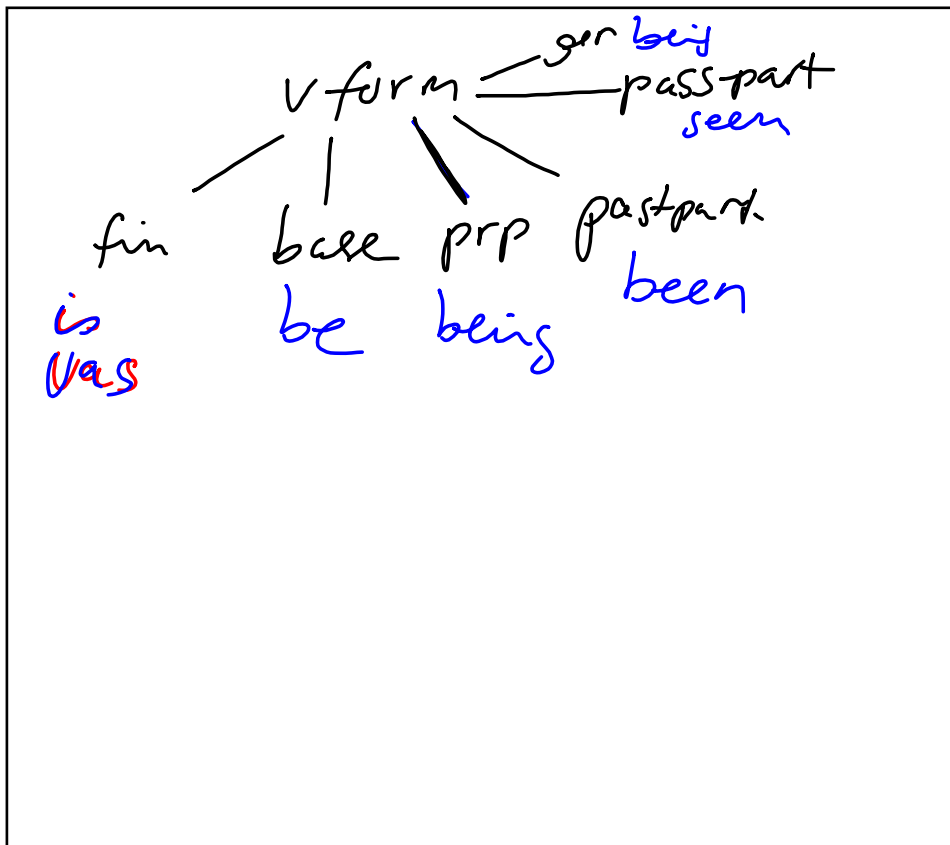

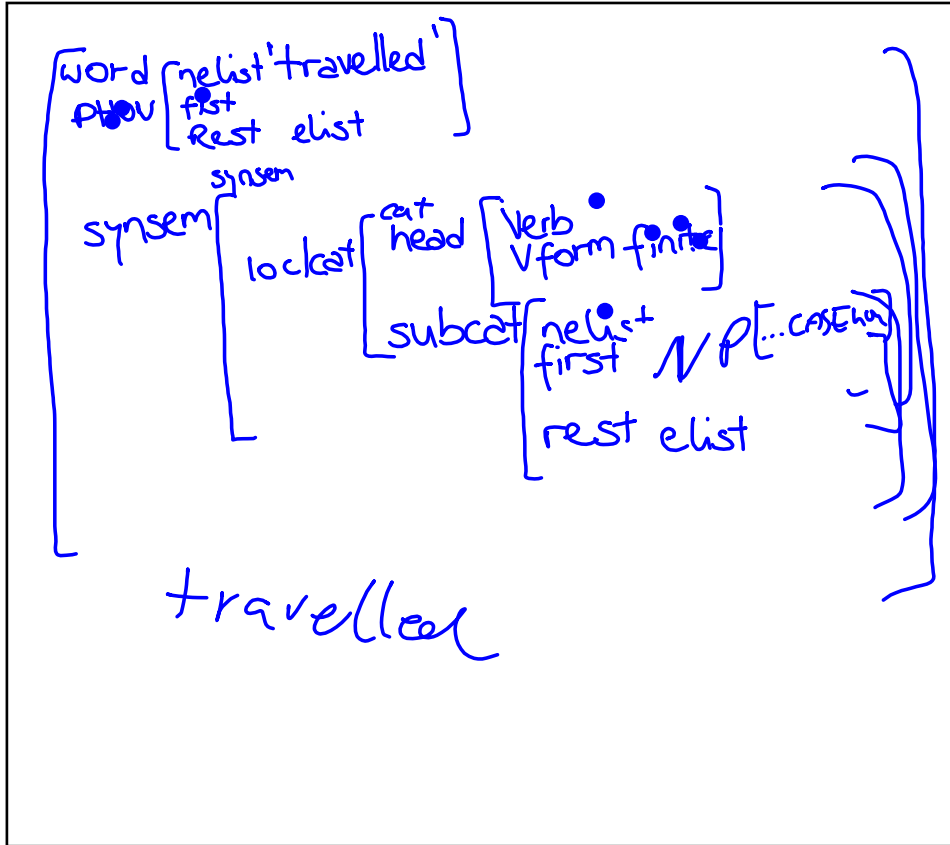

$\langle \text{'marty'} \rangle$

 case case

Marty travelled.

The diagram illustrates a hierarchical tree structure for the word 'marty'. The root node is 'wood', which branches into 'phon' and 'system'. 'phon' further branches into 'helist', 'first', and 'st'. 'system' branches into 'Loc' and 'Loc'. The second 'Loc' node branches into 'cat' and 'Had.'. 'cat' branches into 'noun' and 'subcat'. 'noun' branches into 'case case'. 'subcat' branches into 'exist'. The final output is the sentence 'Marty travelled.'

Semantic combinatorics

$travel_2(u, \text{marty})$

Semantic contributions of the words:

Marty:

marty

likes: travelled

$travel_2 \ u \ _(-, -)$

Jennifer:

Lexical Resource Semantics

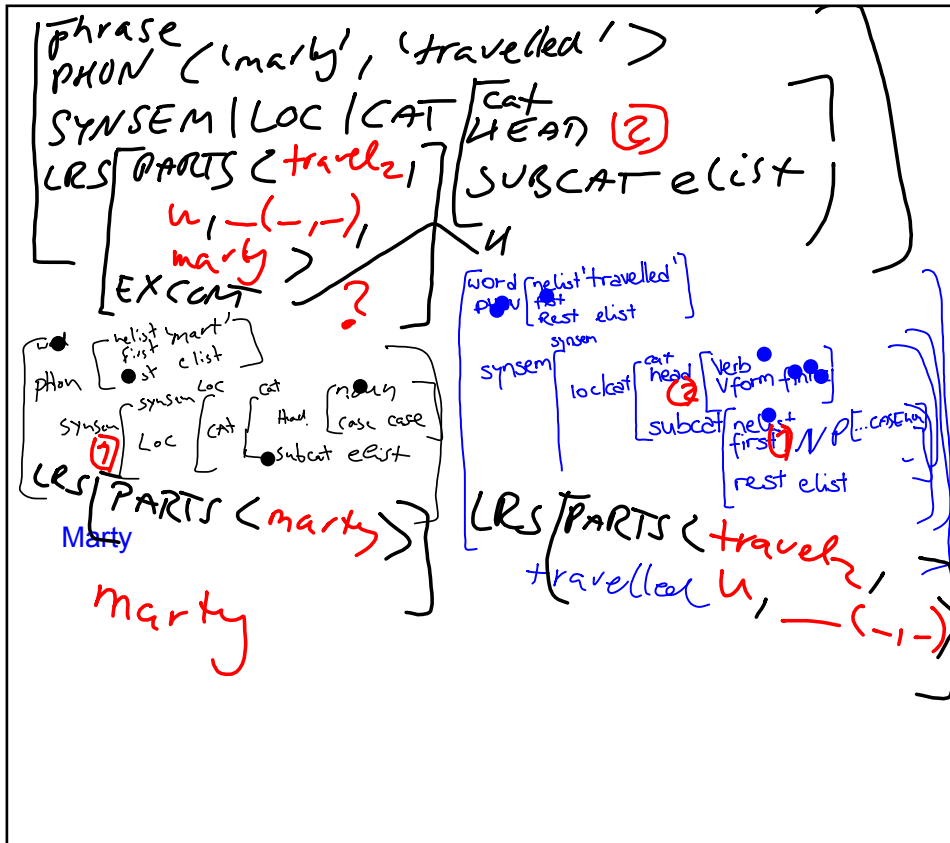

LRS Projection principle:

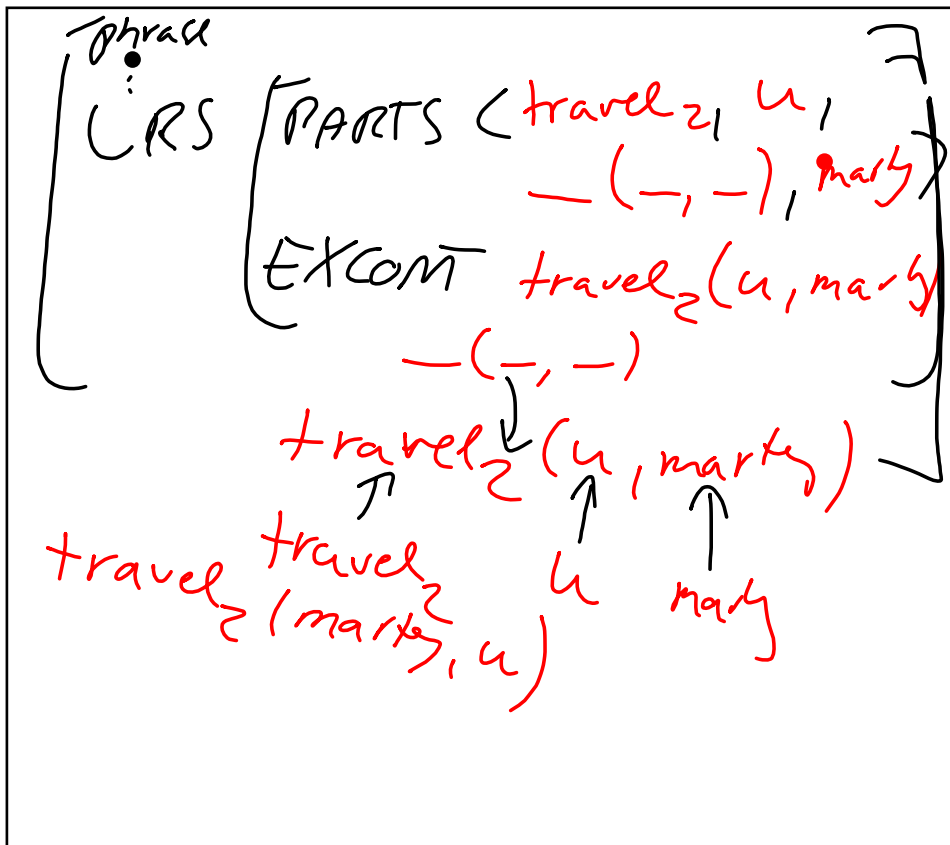

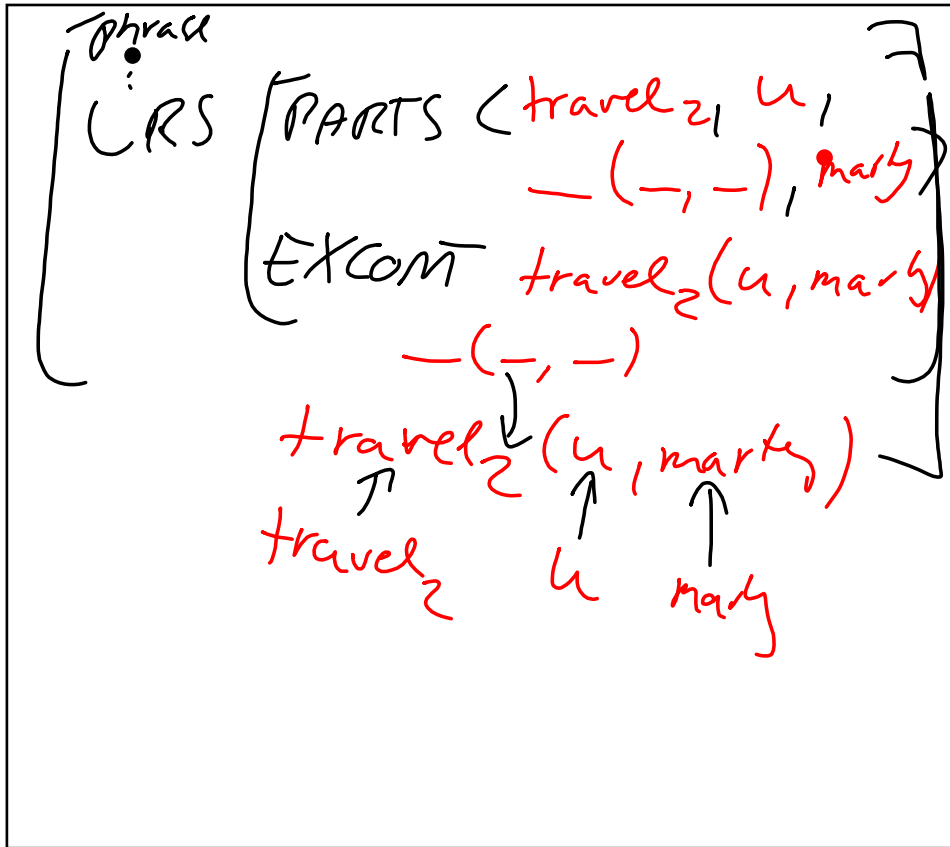

Mother's PARTS contains all of the daughters' PARTS elements and nothing else.

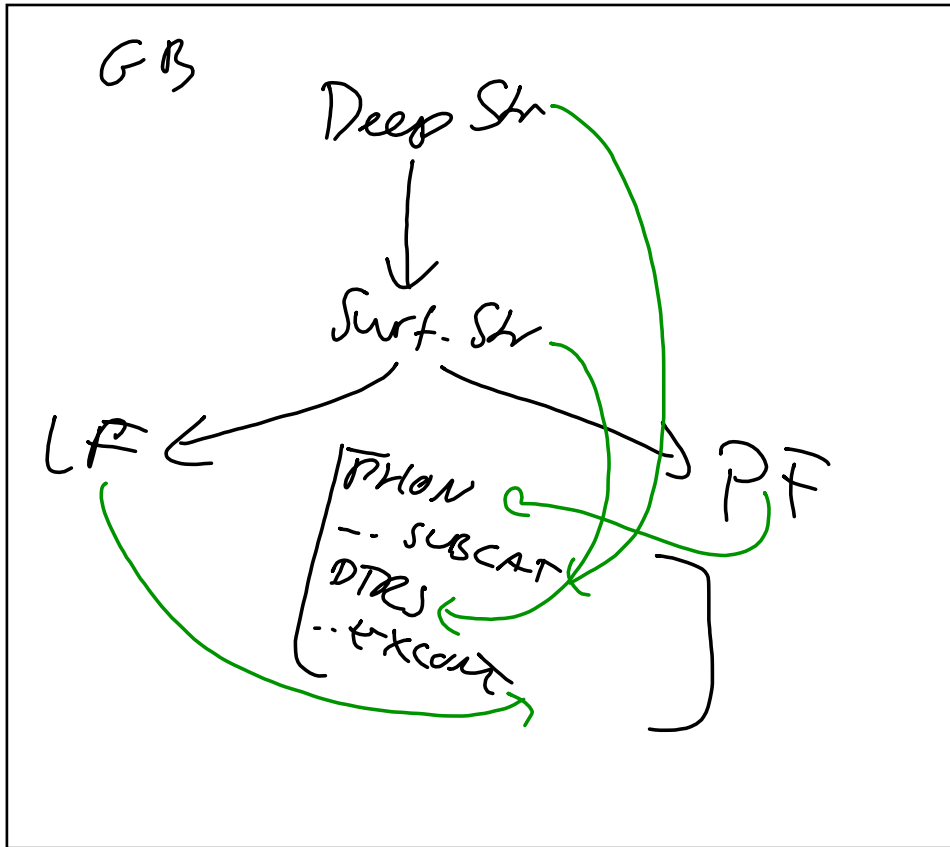

EXCONT Principle:

External context of a sentence
 → the logical form of the sentence

An utterance's EXCONT is a formula that consists exactly of the elements of its PARTS list.

For next week
